

# Introduction to Image Classification using Convolutional Neural Networks (CNNs)

Module 6 - Vision Models

# Agenda

- Inspiration from Nature
- Overview of CNNs
- Key Concepts:
  - Convolution
  - Filters/Kernels
  - Activation Functions
    - Swish Activation Function
  - Pooling Layers
- Image Classification Use Cases
- Advanced Topics Preview
- Q&A Session

# Inspiration from Nature

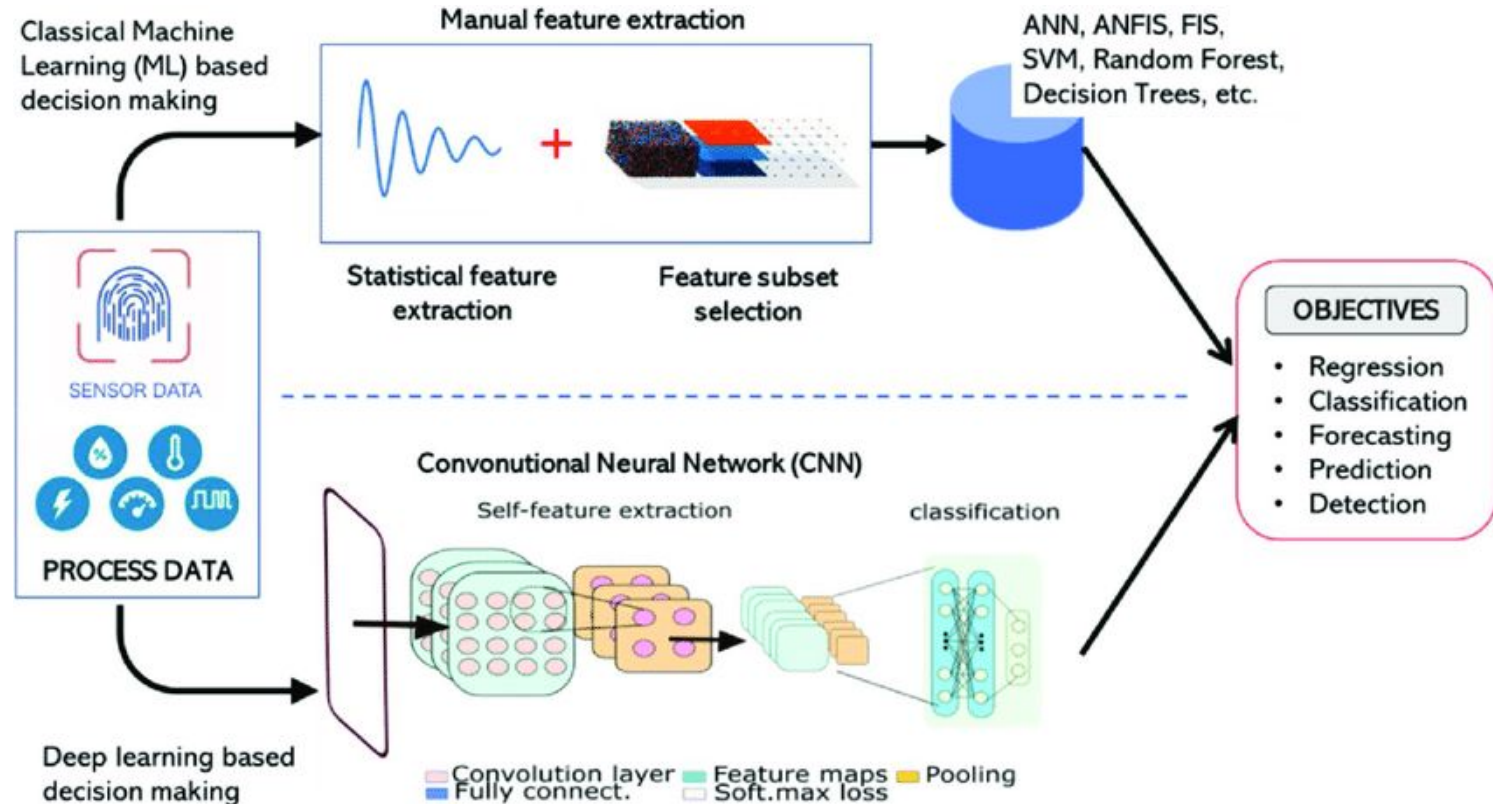

# Introduction to CNNs

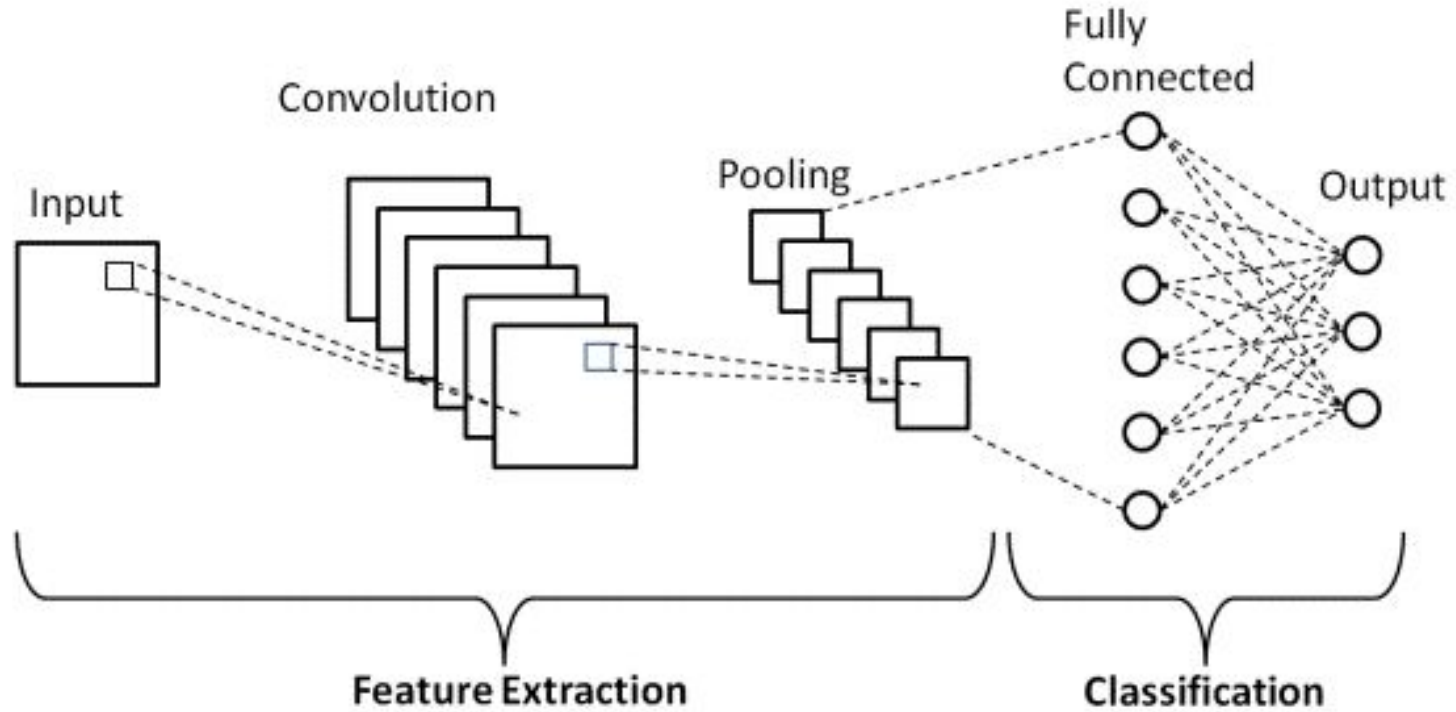

## Convolution Neural Network (CNN)

# Traditional vs. CNN Approach

# CNN Architecture Overview

# Convolution Operation

# Filters/Kernels

# Stride

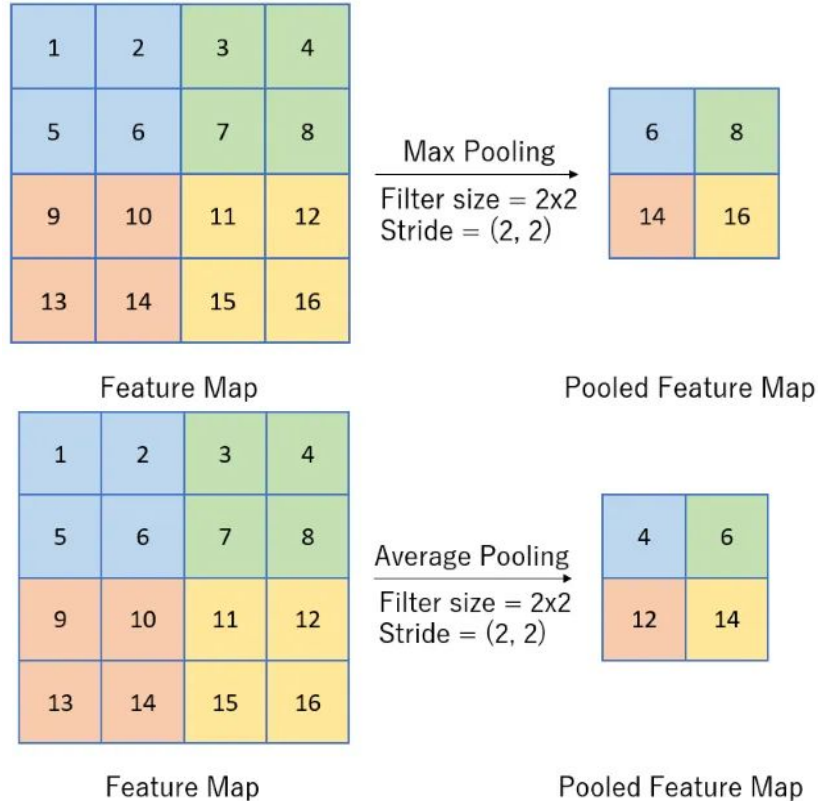

Stride = 1

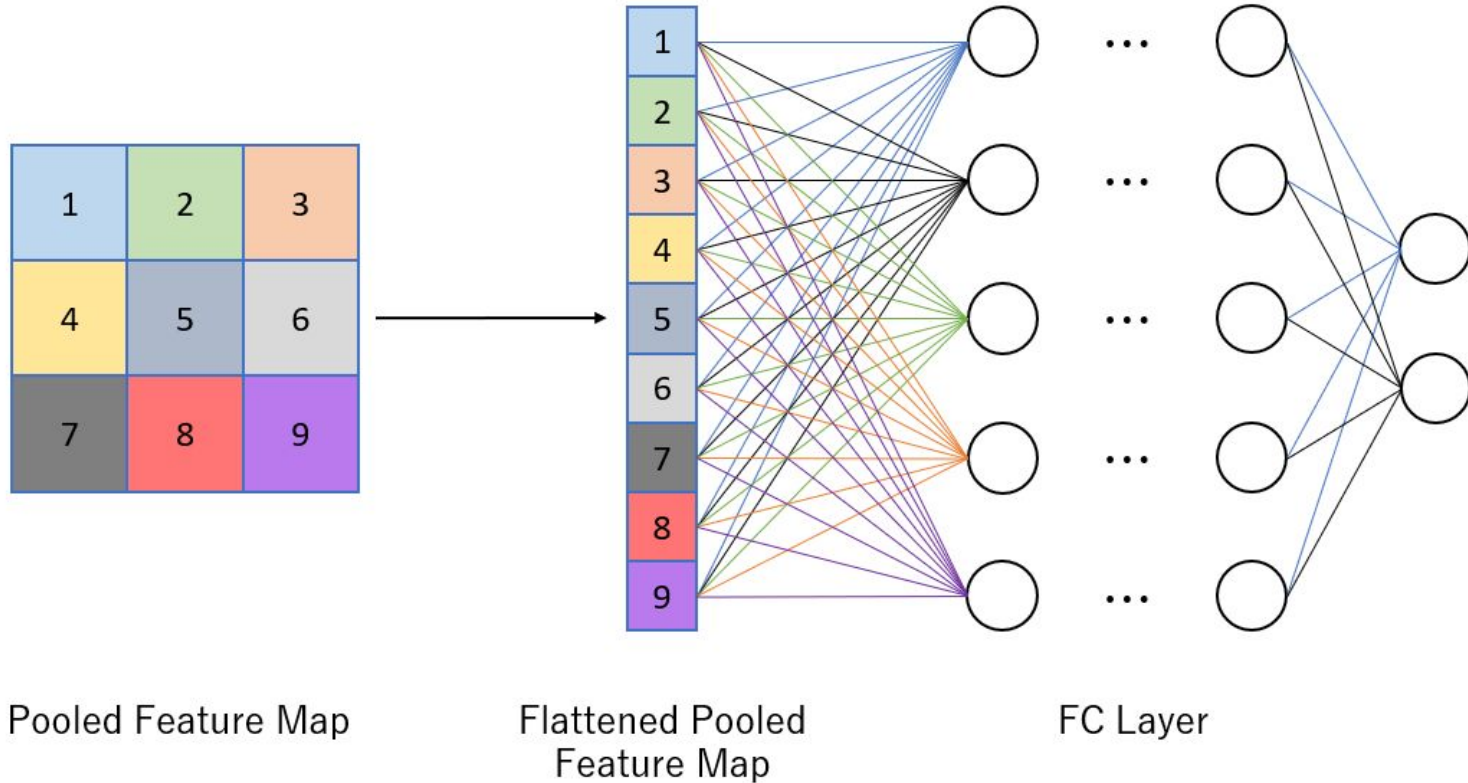

Stride = 2

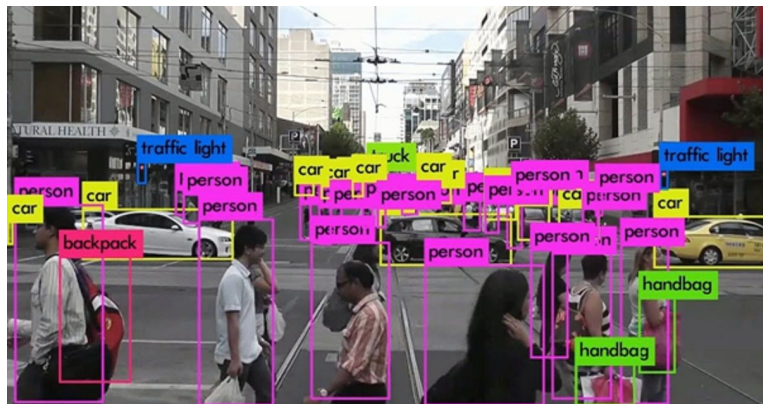

# Pooling Layers

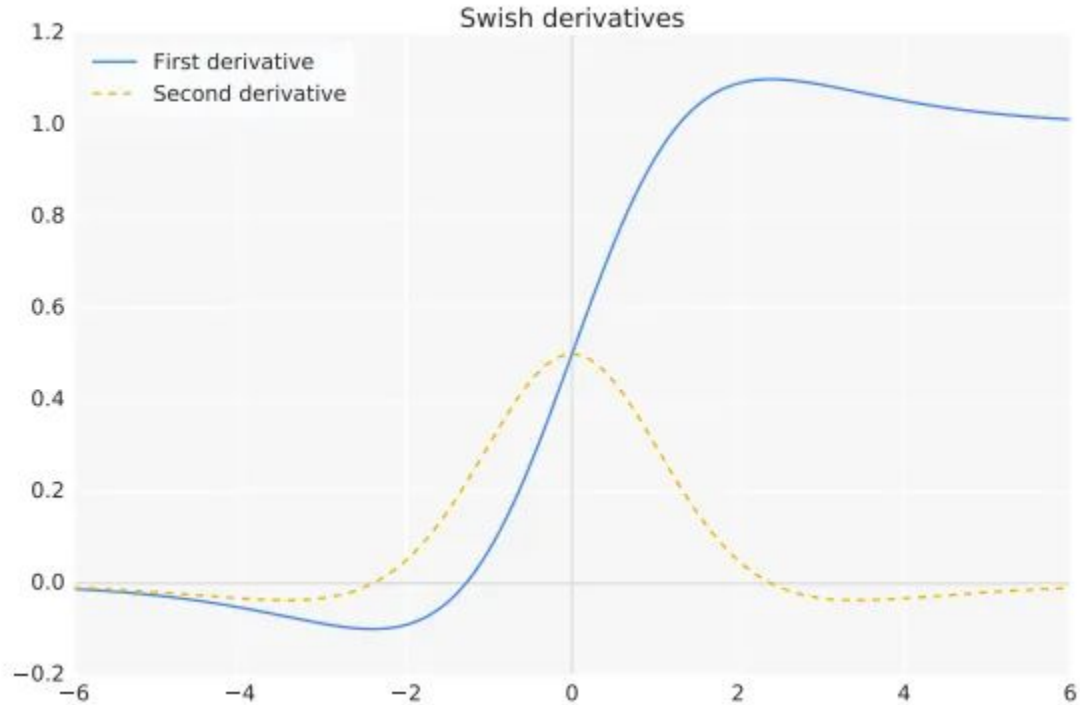

# Fully Connected Layers

# Image Classification Use Cases

# Swish Activation Function

# Advanced Topics Preview

## **Complex Number-based CNNs**

- Introduction to using complex numbers in CNNs
- Advantages: Improved edge detection and phase information handling

## **Image Segmentation**

- Pixel-wise classification for detailed image analysis
- Applications in medical imaging and autonomous driving

## **Defect Detection in Industry**

- CNNs for quality control and anomaly detection
- Importance in manufacturing processes

# Common Challenges and Solutions

1. Computational Complexity with High-Resolution Images
2. Data Annotation and Labeling Challenges
3. Variability and Complexity in Image Data
4. Lack of Invariance to Geometric Transformations
5. Adversarial Vulnerabilities and Robustness

# Summary and Key Takeaways

## **Recap:**

- The structure and function of CNNs.
- Biological inspiration.
- Importance in image classification tasks.

## **Key Points:**

- Automatic feature extraction.
- Handling of spatial data.
- Versatility in various applications.

# Q&A Session

Thanks for listening and see you in the next  
lesson!

# Next Steps

1. Let's have a Kahoot to reinforce concepts!
2. Code Session
3. Quick Overview of the Lab Assignment
